

Alina Evidence-First Research Report Draft

Generated: 2026-05-31T02:17:29.924Z

1. Executive Summary

Alina is a proposed daily companion app combining personal meaning, identity reinforcement, coaching/action, short reset practices, and game-like progression. The research now supports a more precise opportunity statement: adjacent markets and partial substitutes are real, but the under-owned space appears to be the causal loop where completing a daily action visibly changes an identity/avatar feedback object.

Current evidence verdict: **continue research / conditional go**. The market existence signal is strong enough to keep going; the remaining proof burden is competitor manual review, pricing/paywall extraction, app-review/forum evidence, and user validation of the avatar-progress mechanic.

Key quantified signals:

- Expanded competitor universe: 12552 deduplicated rows from 4 source kinds.
- Audience signal rows: 20492.
- High whitespace candidates: 593; medium: 4040; low: 7919.
- Top-100 intersection candidates enriched from App Store metadata: 100/100.
- Strict behavior-tied avatar progression signal in top-100: 1/100.
- Modeled direct intersection SAM base: USD 201960000.

2. Product Hypotheses

ID	Hypothesis	Status	Evidence
H1	Product shape exists	partially supported	Adjacent apps combine several pillars; top-100 shows meaning/action/reset/progress language.
H2	Markets have money	supported with ranges	TAM/SAM/SOM model and 14 market claims across gaming, astrology, avatar, coaching, mindfulness.
H3	Whitespace exists	narrowed	Broad space is crowded; strict behavior-tied avatar progression appears rare in top-100 metadata.
H4	Competitive advantage is plausible	unproven but sharpened	Moat candidate is integrated daily transformation loop, not any single feature.
H5	Shared audience exists	directionally supported	Audience matrix points to digital ritual users across spirituality, identity, self-improvement, calm, and cozy progress.
H6	Product core can be defined	supported for MVP framing	Product-core evidence defines target loop and MVP testable claim.

3. Dataset Overview

Expanded Rows by Niche

- gaming: 3137

- coaching: 2534
- mindfulness: 2399
- avatar_identity: 2281
- astrology_esoterics: 2201

Expanded Rows by Source Kind

- app_store_search: 8103
- steam_search: 2585
- google_play_search_fallback: 1808
- duckduckgo_search: 56

4. Market Sizing

The model intentionally avoids adding five TAMs together. Gaming is treated primarily as a mechanic benchmark; direct SAM is modeled from discounted adjacent consumer app markets.

Pillar	TAM Low	TAM Base	TAM High	SAM Low	SAM Base	SAM High	Confidence
gaming	113000000000	134220000000	166000000000	226000000	671100000	1660000000	medium
astrology_esoterics	5690000000	6240000000	16070000000	170700000	374400000	1607000000	low_medium
avatar_identity	1920000000	8400000000	14130000000	38400000	420000000	1130400000	medium
coaching	4220000000	5000000000	6690000000	126600000	300000000	669000000	medium
mindfulness	1680000000	1680000000	4620000000	134400000	252000000	1155000000	medium
intersection	470100000	1346400000	4561400000	37608000	201960000	1140350000	low

SOM Sensitivity

Scenario	Reachable Users	Activation	Paid Conversion	ARPPU/year	Annual Revenue
conservative_12m	100000	0.35	0.03	60	63000
base_24m	1000000	0.4	0.05	80	1600000
upside_36m	5000000	0.45	0.08	100	18000000
breakout_36m	10000000	0.5	0.1	120	60000000

5. Competitive Landscape

Top-100 Archetype Mix

- manifestation_tool: 30
- avatar_identity_coaching: 23
- gamified_self_improvement: 16
- astrology_guidance: 12
- tarot_or_oracle_guidance: 9

- faith_devotional_habit: 8
- ai_companion_roleplay: 2

Pricing Signals

- free_entry: 28
- credits_or_consumables: 21
- subscription: 8
- premium: 7
- enterprise_or_human_service: 2
- trial: 2

Retention Signals

- streaks: 92
- reminders_habits: 92
- journaling_reflection: 72
- social: 69
- xp_levels: 60
- daily_loop: 57
- avatar_feedback: 54
- quests_challenges: 30

6. Whitespace Analysis

Broad whitespace is weak: the market already has many products that combine meaning, habits, AI, mindfulness, and identity language. Narrow whitespace is stronger: top-100 metadata shows only one strict signal of behavior-tied avatar progression.

Product Core Signals in Top-100

Core Element	Detected	Out Of
Personal meaning	100	100
One daily action	96	100
Short reset	80	100
Avatar or identity	100	100
Behavior-tied progression	1	100
Next-day hook	94	100

7. Audience Segmentation

The strongest shared-audience hypothesis is not "people who use all five app categories." It is people who already use digital rituals to regulate identity and emotion.

Audience signal counts:

- gen_z_creator_identity: 5754
- casual_gamers: 4098
- self_improvement_users: 4067
- anxious_stressed_users: 3072
- spiritual_seekers: 2569
- coaching_professionals: 932

8. Product Core

Target loop: personal meaning -> one daily action -> short reset -> avatar/identity feedback -> visible progression -> next-day hook.

MVP testable claim: users should understand and complete the full daily loop in under two minutes, then report that the avatar/progress cue makes the action feel more personally meaningful.

9. Risk Register

Risk	Severity	Mitigation
Fragmentation	high	Force one daily flow; avoid separate feature tabs as MVP core.
Avatar novelty churn	high	Tie avatar changes to completed actions and progress, not one-off image generation.
Astrology trust/overclaiming	high	Use soft framing, confidence labels, and avoid deterministic claims.
AI hallucination in guidance	high	Constrain advice to low-stakes coaching prompts and clear disclaimers.
Subscription fatigue	medium	Keep daily loop free; monetize depth/personal analysis/advanced progress.
Crowded adjacent markets	medium	Position around integrated transformation loop, not generic astrology/mindfulness/avatar.

10. Go/No-Go Status

Current status: conditional go for continued validation, not yet go for full product build.

Go signals present:

- Adjacent markets have meaningful revenue pools.
- Users are already trained on daily loops, streaks, reflection, and spiritual/personalized guidance.
- Top-100 evidence suggests avatar/identity is common but behavior-tied avatar progression is rare.

Remaining proof required:

- Manual validation of the top-100 candidates.
- Reviews/forums for user pain language and subscription objections.
- Pricing/IAP extraction beyond App Store metadata.
- Prototype test of the two-minute daily loop.

11. Source and Claim Layer

Market claims currently normalized: 14.

Claim ID	Market	Value	Period	Confidence	Source
CLM-MKT-0001	mobile gaming	113000000000	2025	High	SRC-MKT-0002
CLM-MKT-0002	mobile gaming	166000000000	2030	High	SRC-MKT-0002
CLM-MKT-0003	meditation and mindfulness apps	1680000000	2026	Medium	SRC-MKT-0003
CLM-MKT-0004	meditation and mindfulness apps	4620000000	2034	Medium	SRC-MKT-0003
CLM-MKT-0005	AI avatars	8400000000	2026	Medium	SRC-MKT-0004
CLM-MKT-0006	AI avatars	93400000000	2035	Medium	SRC-MKT-0004
CLM-MKT-0007	coaching		2026	High	SRC-MKT-0005
CLM-MKT-0008	coaching		2026	High	SRC-MKT-0005
CLM-MKT-0009	astrology apps	16070000000	2026	Low	SRC-MKT-0007
CLM-MKT-0010	astrology apps	6240000000	2026	Low	SRC-MKT-0008
CLM-MKT-0011	astrology apps	5690000000	2026	Medium	SRC-MKT-0009
CLM-MKT-0012	coaching platforms	4220000000	2026	Medium	SRC-MKT-0011

13. Next Work

1. Complete manual review of top 100 intersection candidates.
2. Pull and cluster app reviews for close competitors.

3. Extract detailed IAP/subscription pricing where accessible.
4. Build visual charts and render the PDF version.
5. Update go/no-go decision after manual review and review-language evidence.
