

Product / Investor Deck

What The Leaders Already Prove

Nebula / Co-Star

personal guidance

birth data, weekly meaning, compatibility, paid readings

\$718K-\$797K/mo iOS estimates

Calm / Headspace

daily ritual

subscription trust, annual plans, wellness habit

\$300M/yr Calm proxy

Finch / Replika

companion loop

memory, avatar, gentle return, emotional continuity

\$1.5M-\$2.36M/mo estimates

Runway / HeyGen

visual AI layer

video/avatar as premium output, not cheap daily commodity

Runway 8s Gen-4 Turbo ~= \$0.40

The market already has the ingredients. AURA is the product format that connects them into one causal weekly experience.

personal meaning

daily ritual

memory / assistant

Life Canvas / video

AURA is not “another horoscope app”. It is a weekly life-series where meaning becomes action and action changes the visual state.

What AURA Is

- One-line thesis —** AURA is a weekly visual self-guidance app: birth data + personal context → forecast → daily episode → action/reset → Life Canvas change → tomorrow hook.
- User promise —** Not “your zodiac sign says X”. The user should feel: “I understand my week, I did one small action, and I can see how my life picture changed.”
- Core product —** A personal pocket forecastist/assistant with memory, weekly seasons, image-first Life Canvas and rare premium video moments.
- Why now —** Astrology apps monetize personal meaning, mindfulness apps monetize ritual, AI companions monetize memory, video AI creates premium visual moments. AURA joins these behaviors.
- Business rule —** Daily loop must stay cheap. Premium video/avatar must be tokenized, milestone-based or paid, not free daily generation.
- Strategic gate —** If users cannot explain why Life Canvas changed, AURA becomes an AI image toy. If they can, AURA becomes a product.

**The loop is the product: Episode → Action → Reset → Reflection → Life Canvas
→ Tomorrow Hook.**

AURA only works if the user understands the sequence: input → meaning → action → visible change → return tomorrow.

These are not final UI designs. They define what the designer must make visible on screen.

Before action

After action

Because the user completed the reset and reflection, the Canvas changes from “fog / pressure” to “clear route / grounded self”.

If the user says “AI just drew another picture”, the product fails. If the user says “the picture changed because I acted”, AURA is alive.

**WEEK
TRAILER**

Premium video moment

Video can be included in the subscription only if the model is cheap and capped: one 8s video per

Runway 8 sec	~\$0.40 COGS
4 videos/mo	~\$1.60 COGS
30 daily images	~\$0.60-\$1.20 COGS
Total media	~\$2.20-\$3.80/mo before buffer

The business move: sell a visual subscription package, but cap it tightly and track every generated asset.

Paywall appears after the first completed loop, not before the user understands the product.

What existing apps give

- Astrology: meaning, but often generic and passive.
- Mindfulness: ritual, but often not personal enough.
- AI companion: conversation, but not a structured week.
- Avatar tools: visuals, but weak causality.

What AURA combines

- Birth-data context without fatalistic positioning.
- A weekly season that gives structure.
- A daily micro-action that creates agency.
- A Life Canvas that changes for a reason.
- Premium video as rare proof-of-magic, not daily COGS leak.

Market Map

consumer mobile apps

AI/ML competes for the daily habit of opening an app for meaning, reset and self-direction.

4 paid behaviors

personal guidance, wellness ritual, AI companion memory, visual identity/avatar progression.

apps + web + AI tools

existing research covers app stores, web apps, paywalls, adjacent tools and manual competitor walkthroughs.

100k-300k users

reachable first scale if creator-led GTM, weekly seasons and premium visual moments work.

\$30-80M ARR path

subscription + annual + premium tokens + creator seasons can create venture-relevant upside.

The market is not a single horoscope TAM. It is the overlap of paid personal meaning, daily ritual and AI visual identity.

How The Numbers Work

External signals

Rev.now / Sacra / press / API
pricing

Revenue, MAU, payers, price,
public COGS

Derived benchmarks

calculated from public signals

ARPMU, paid conversion,
CAC bands, COGS per user

AURA assumptions

conservative / base / strong

pricing, conversion, token
attach, no-free-video rule

Product decisions

what we actually build

Plus, annual, token video,
image-first Life Canvas

The deck does not treat competitor estimates as truth. It uses them to create bounded assumptions for AURA.

The Four Numbers That Matter

2.5-3.0% **base paid conversion**

derived from Co-Star / Nebula / The Pattern style
subscription apps

\$0.35-\$0.50 **base ARPMAU target**

AURA needs subscription + some visual/token uplift to beat
long-tail astrology

\$0.80-\$1.50 **strong ARPMAU
target**

only if high-intent premium moments work: future-self,
relationship, video

<\$1.50 **payer AI/image
COGS target**

daily loop must be cheap enough for \$9.99-\$14.99
subscription

If one of these four numbers breaks, the product model must change.

Competitor Economics: The Read

Proof question	Competitor signal	What it proves	AURA decision
Will people pay for personal meaning?	Co-Star iOS: \$797.5K/mo, 2.7M MAU, 64K payers	yes, but conversion is closer to 2-3%	model base conversion at 2.5-3.0%
Can spiritual guidance monetize?	Nebula iOS: \$718K/mo, 52K payers, \$0.33 ARPMAU	yes, but aggressive paywalls create trust risk	sell causality and season, not vague psychic pressure
Can daily ritual become large?	Calm: \$300M/year proxy, 4M+ subscribers	yes, if trust and annual habit exist	annual plan after first completed week
Can AI/avatar create paid intent?	Replika Android: \$2.36M/mo estimate, 99K payers proxy	yes, users pay for memory/avatar/voice	assistant memory + visual identity layer
Can urgent guidance lift ARPMAU?	AstroTime Android: \$1.82 ARPMAU, 4.5% conversion	yes, high-intent moments monetize better	future-self / relationship / video tokens

AURA should model base-case like subscription self-discovery, and upside like premium visual/guidance moments.

Product	Revenue / scale signal	Visible economics	AURA implication
Co-Star iOS	\$797.5K/mo; 2.7M MAU; 64K payers	ARPMU ~\$0.30; conversion ~2.4%; \$8.99/mo + IAP	base paid conversion should be 2-3%, not fantasy 8-10%
Nebula iOS	\$718K/mo; 2.2M MAU; 52K payers	ARPMU ~\$0.33; conversion ~2.4%; \$9.99/mo + weekly IAPs	personal guidance monetizes, but paywall trust is fragile
The Pattern iOS	\$36.1K/mo; 160K MAU; 4K payers	ARPMU ~\$0.23; conversion ~2.5%	relationship/self-insight works, but depth alone does not guarantee scale
AstroSage Android	\$547.8K/mo; 2.4M MAU; 34K payers	ARPMU ~\$0.23; conversion ~1.4%	birth-data utility can bring huge reach with lower conversion
AstroTime Android	\$440.8K/mo; 242K MAU; 11K payers	ARPMU ~\$1.82; conversion ~4.5%	urgent guidance mechanics can lift conversion and ARPMU
Astrotalk company	Rs 1,214 crore FY25 total revenue reported	consultation marketplace, not pure app subscription	human/expert layer is upside later, not MVP core

Source layer: Rev.now estimates and public company/press reports. Directional benchmarks, not audited internal P&L.

Product	Revenue / scale signal	Visible economics	AURA implication
Calm brand	\$300M/year proxy; 4M+ paying subscribers	\$70/year and \$14.99/mo price anchors	annual wellness subscription can be very large when trust and routine exist
Calm Android	\$2.35M/mo; 3.6M MAU; 85K payers	ARPMU ~\$0.65; conversion ~2.4%	wellness can monetize above astrology ARPMU, but needs retention
Headspace	~\$200M/year brand proxy; app-store proxy	\$12.99/mo price signal	off-store/B2B revenue can understate visible app economics
Waking Up	\$492.7K/mo iOS leaderboard estimate	\$19.99/mo; \$129.99/year	trusted teacher voice can justify premium pricing
Balance Android	\$180K/mo; ~317K MAU; 11K payers	ARPMU ~\$0.57; conversion ~3.5%	personalization can outperform generic meditation libraries
Meditopia iOS	\$118.4K/mo; 629K MAU	ARPMU ~\$0.19	large MAU without strong monetization can still be thin

AURA should borrow daily ritual and annual plan logic, not build a giant meditation library.

Product	Revenue / scale signal	What people pay for	AURA implication
Character.AI	\$30M-\$32M ARR proxy; c.ai+ \$9.99/mo	priority, memory, engagement, chat volume	AI can monetize engagement, but inference cost and safety dominate
Replika Android	\$2.36M/mo estimate; 99K payers proxy	AI companion, avatar, memory, voice/video features	users pay for emotional continuity, not raw text chat
Finch iOS	\$1.5M-\$2.0M/mo public estimate range	self-care pet, soft progression, daily loop, Plus features	daily companion mechanics can monetize without scary "therapy" positioning
HeyGen / D-ID	API pricing proves avatar video is paid compute	\$0.05-\$0.0667/sec or plan/credit based pricing	talking avatar is a premium event, not free habit content
AURA	\$9.99-\$14.99/mo + tokens target	season, assistant memory, Life Canvas, rare video	must be a cost-controlled AI product under a premium visual wrapper

The avatar is not decoration. It has to show the user why the week changed.

A

What People Actually Pay For

Paid object	Seen in competitors	Why users pay	AURA equivalent
Monthly subscription	Co-Star, Nebula, CHANI, Calm, Balance	regular personal value and lower friction	AURA Plus: weekly season + memory + Life Canvas
Annual subscription	Calm, Headspace, Waking Up, CHANI	commitment and cashflow when trust is formed	\$69-\$89 annual after first completed week
Compatibility / relationship report	Co-Star, The Pattern, Nebula	emotionally high-stakes personal insight	relationship / future-self special episode
Live or urgent guidance	Astrotalk, AstroTime, Astroyogi	anxiety moment: "answer me now"	AI assistant first; human/creator layer later
Special visual asset	soulmate sketch, aura reading, avatar/video tools	ownable image of self/future/period	Life Canvas trailer or future-self video token

Plan	Price	Included generation	Target margin logic
Free	\$0	first forecast + Day 1 loop + one medium Life Canvas	COGS target <\$0.20; goal is activation, not generosity
Plus monthly	\$9.99-\$14.99	daily text loop, memory, weekly recap, 2-4 images/mo	net after app fee ~\$8.49-\$12.74; COGS target <\$1.50
Plus annual	\$69-\$89/year	same loop + annual season framing	cashflow and lower churn pressure
Low video token	\$2.99-\$4.99	Runway/Luma-class 5-8 sec visual moment	works if COGS <\$1 and retries are capped
Premium video token	\$6.99-\$9.99	Veo/Replicate/HeyGen high-quality moment	needed when COGS is \$2-\$4+
Creator season	\$14.99-\$29.99	limited guided pack / custom assistant style	monetizes content leverage, not only compute

AURA should not sell unlimited AI. It sells season, memory, causality and rare premium visual events.

Conversion / ARPMAU Assumptions

Metric	Conservative	Base	Strong
Paid conversion	1.5%	2.5-3.0%	4.0-5.0%
Monthly ARPMAU	\$0.20	\$0.35-\$0.50	\$0.80-\$1.50
Monthly price	\$7.99-\$9.99	\$9.99-\$14.99	\$14.99
Token buyer share	3%	8-12%	15-20%
CAC payer	\$300-\$800	\$100-\$250	\$30-\$100
Verdict	content app risk	works if causality is understood	works only with high-intent moments

These assumptions are derived from competitor estimates: Co-Star, Nebula, The Pattern, AstroSage, AstroTime, Calm and Balance.

From Benchmarks To AURA Model

Input	Observed / benchmark range	AURA base assumption	Why this is reasonable
Paid conversion	1.4-2.5% subscription astrology; 3.5% Balance; 4.5% AstroTime	2.5-3.0%	base case assumes value is proven before paywall
ARPMU	\$0.19-\$0.37 subscription astrology; \$0.57-\$0.65 wellness; \$1.82+ urgent guidance	\$0.35-\$0.50	AURA needs to outperform generic astrology through visual/token uplift
Monthly price	\$8.99-\$14.99 common paid band; \$19.99+ premium teacher apps	\$9.99-\$14.99	sits inside proven consumer subscription range
Video COGS	Runway ~\$0.40 / 8s; Veo ~\$4 / 8s; HeyGen ~\$1.50-\$2 / 30s	4 Runway clips / paid month; no free video	weekly video can sit in Plus only if model, retries and count are capped
CAC payer	\$50-\$150 organic/social; \$150-\$500+ paid web2app	\$100-\$250 base	paid acquisition only after retention and paywall data

This is the missing bridge: competitor data is not the model; it is the guardrail for the model.

Generation Subscription Package

PLUS PACKAGE

30 daily cards
30 images
4 weekly 8s
videos
memory + recap

~\$2.40-\$4.05

**COGS / paid user /
month**

Asset	Frequency / month	Model option	Unit COGS	Monthly COGS
Daily card text	30	LLM mini / structured prompt	\$0.003-\$0.008	\$0.10-\$0.25
Daily image / Life Canvas frame	30	Runway gen4_image_turbo or low-cost image model	\$0.02-\$0.04	\$0.60-\$1.20
Weekly 8s video	4	Runway Gen-4 Turbo, 5 credits/sec	~\$0.40	~\$1.60
Retry / failed generation buffer	20-30%	media retry reserve	n/a	\$0.50-\$1.10
Storage / infra / analytics	month	S3 + backend + events	n/a	\$0.20-\$0.50
Total paid user COGS	Plus package	subscription generation bundle	n/a	~\$2.40-\$4.05/mo

This is the recommended subscription bundle: 30 daily visual cards + 4 weekly videos, tightly capped.

A

Free User Cost & Conversion Break-Even

Free scenario	Included usage	Free COGS / activated user	What must happen
Light free trial	first forecast + 3 cards + 1 image	\$0.08-\$0.18	safe for broad acquisition tests
7-day free loop	7 daily cards + 7 images + no video	\$0.25-\$0.55	only works if D1/D7 and paywall intent are visible
Free video trial	1 free 8s Runway video	+\$0.40-\$0.60	risky unless it dramatically improves conversion
Plus contribution	\$14.99 price, 15% fee, \$2.40-\$4.05 COGS	\$8.70-\$10.35 / month	base subscription margin per payer
Break-even CAC activated	3% conversion, 3-month payer life	~\$0.53-\$0.75	paid ads cannot scale yet without better LTV
Strong CAC activated	5% conversion, 4-month payer life	~\$1.55-\$2.05	possible only with strong retention and visual proof

Free users are not free. AURA should test paid acquisition only after free COGS and paywall conversion are measured.

Generation Cost Benchmarks

Layer	Provider / model	Public price signal	AURA implication
LLM	OpenAI GPT-4.1 mini	\$0.40 / 1M input tokens; \$1.60 / 1M output tokens	daily text loop is cheap if prompts are structured
Image	OpenAI Images	~\$0.01 low / \$0.04 medium / \$0.17 high per square image	Life Canvas can be included if image count is capped
Cinematic video	Google Veo 2 / Vertex AI	~\$0.50 per generated second	8 sec ~= \$4.00; cannot be free daily content
Cinematic video	Runway API	\$0.25 per 5 sec API example	8 sec ~= \$0.40; viable for tests, still needs retry budget
Video model	Replicate Wan 2.1 720p	\$0.24 per output second	8 sec ~= \$1.92; better as paid token / milestone
Talking avatar	HeyGen API Avatar IV/V	\$0.05/sec photo avatar; \$0.0667/sec digital twin	30 sec ~= \$1.50-\$2.00; not a default daily loop
Avatar API	D-ID Build plan	\$14.4/mo annual plan; up to 16 offline video min	~\$0.90/min plan math, but limits/watermark/credits matter

All prices are public API/pricing-page signals as of June 2026; exact billing must be rechecked before procurement.

A

Cost Per User / Month

User type	Usage assumption	Variable AI cost	Business meaning
Free active user	8 text loops + 1 medium image + no video	\$0.10-\$0.20 / MAU	safe if onboarding is capped and no free video exists
Engaged free user	20 text loops + 2 images + no video	\$0.25-\$0.45 / MAU	acceptable only if retention and conversion are visible
Plus with Runway video	30 cards + 30 images + 4 weekly 8s videos	\$2.40-\$4.05 / payer	\$14.99 subscription can hold margin if retries are capped
Plus with Veo video	+ four weekly 8s Veo clips	+\$16.00 before retries	too expensive for base subscription
Premium avatar token	HeyGen / talking-avatar moment	\$1.50-\$2.00 per 30 sec	sell as separate pack or milestone
High-quality video token	Replicate / Veo / premium model	\$1.92-\$4.00 per 8 sec	price token by model quality

COGS = LLM tokens + images + video seconds × provider price + storage + support + failed-generation buffer.

The daily product can be cheap. Weekly video is viable only as a capped paid subscription benefit or token.

Video Cost Stress Test

Scenario	100 users	1,000 users	10,000 users	Conclusion
4 weekly Runway clips / payer	\$160	\$1,600	\$16,000	viable inside \$14.99 Plus if paid cohort is real
4 weekly Veo clips / payer	\$1,600	\$16,000	\$160,000	not viable as base subscription bundle
1 free Runway trial clip	\$40 COGS	\$400 COGS	\$4,000 COGS	only if it sharply lifts paid conversion
1 premium Replicate/Wan clip	\$192 COGS	\$1,920 COGS	\$19,200 COGS	needs \$4.99-\$9.99 token or bundle
1 paid 30s HeyGen avatar	\$150-\$200 COGS	\$1,500-\$2,000	\$15,000-\$20,000	works for premium forecast / assistant moment
30 daily Life Canvas images	\$60-\$120 COGS	\$600-\$1,200	\$6,000-\$12,000	safe only for paid users, capped retries

This is the decision: Runway can be the weekly subscription video; Veo/avatars stay premium or later.

AURA Base Financial Model

Scenario	10k MAU	50k MAU	150k MAU
Paid conversion	1.5%	3.0%	4.5%
Payers	150	1,500	6,750
Gross subscription @ \$14.99	\$2.2K/mo	\$22.5K/mo	\$101.2K/mo
Net after 15% fee	\$1.9K/mo	\$19.1K/mo	\$86.0K/mo
Paid-user generation COGS	\$0.4K-\$0.6K	\$3.6K-\$6.1K	\$16.2K-\$27.3K
Verdict	thin until retention is proven	works if free COGS is capped	strong if annual + token upsell work

Base model assumes Plus users receive 30 daily visuals and 4 Runway 8s videos per month.

Competitor / archetype	Public marketing signal	Risk	AURA use
Nebula	\$6.8M/mo YouTube ad spend estimate; 620	paid scale requires high LTV and aggressive funnel	use as paid-test inspiration, not MVP operating model
Nebula prelands	soulmate sketch 10% ad traffic; marriage	curiosity hooks can become scammy	test future-self / visual week / relationship hooks carefully
Co-Star	20M+ downloads with no real marketing spend; 25%	hard to force virality	build shareable identity language and relationship/social hooks
Astrotalk	FY25 total expenses Rs 1,129 crore;	marketplace growth is expensive operationally	do not start with marketplace/expert model
CHANI / Waking Up	trusted founder/teacher voice	requires real authority	use Alina/creator expertise without guru tone

Sources: Web2App World, Axios/TIME, Moneycontrol/ET-style reporting and qualitative product observations.

AURA Marketing Funnel Model

Stage	Conservative	Base	Strong	Decision
Visitor -> signup	8%	15%	25%	landing must be tested before ad scale
Signup -> activated	35%	50%	65%	activation = first completed loop
Activated -> paid	1.5%	3.0%	5.0%	paywall after value moment
CAC activated target	<\$0.50	<\$1.00	<\$2.00	based on COGS + contribution margin
First test budget	\$500	\$1,500-\$3,000	\$5,000	small tests before scaling
First 1,000 users	warm/interviews	creator + organic	creator + paid test	Alina marketing layer can sit above this

Marketing cannot be modeled separately from free COGS. If free usage is generous, CAC must be extremely low.

Go-to-Market Strategy

- 1. First 100 are not bought by ads** warm users, interviews, manual weekly forecasts and concierge cohort. Goal: understand the loop, not installs.
- 2. Creator-led proof** micro creators in astrology/self-growth/visual AI pass a 7-day season and show the experience, not a generic ad.
- 3. Short-form hooks** future-self, weekly forecast, avatar transformation, “not horoscope”, before/after Life Canvas and paid-intent CTA.
- 4. Shareable artifacts** Life Canvas card, season recap, future-self poster and trailer week as viral layer after value moment.

Week 1

20-30 interviews +
manual weekly forecast
concierge

Week 2

10-screen prototype + 2
Life Canvas visual styles

Week 3

landing + price test
\$7.99 / \$9.99 / \$14.99

Week 4

30-50 users through 3-7
days + paid-intent test

Success metrics

>70% understand category / >50% explain Canvas change / D1 >20% / paid intent >5%

Layer	MVP	Later	Why
Core loop	Episode → Action → Reset → Reflection → Life Canvas	season branching and deeper memory	must prove causality first
Assistant	chosen tone + weekly context + memory summary	voice/video assistant, creator voices	text memory is cheaper and faster to validate
Visual layer	image-first Life Canvas + avatar style	cinematic video, talking avatar	video is premium COGS
Monetization	Plus + annual + one token test	creator seasons, expert layer, marketplace	avoid operational complexity before retention
Community	none in MVP	sharing, social, cohorts	do not build social network before core value is proven

Risks

Risk	How it breaks	Mitigation
Looks like horoscope	user thinks it is generic astrology	position as weekly life-series and action, not fate
Avatar feels random	user cannot explain visual change	show cause next to Canvas and tie it to action/reflection
Video cost kills margin	free users generate expensive clips	premium/token video only; log COGS per asset
AI sounds generic	low trust and no return	prompt QA, user feedback and memory guardrails
No paid intent	users like it but do not pay	paywall after first completed loop and price tests by cohort

Growth Roadmap

The roadmap stays narrow until the loop is proven: first causality, then retention, then paid scale.

What We Should Build

Product —	A weekly visual self-guidance app where the user enters birth data/context, receives a forecast, completes daily micro-actions, and sees Life Canvas evolve.
MVP —	Text-first assistant, weekly season, daily episode, action/reset/reflection, image-first Life Canvas, Plus paywall, one premium video token test.
Pricing —	\$9.99-\$14.99 monthly, \$69-\$89 annual, \$2.99-\$9.99 visual/video tokens, no unlimited generation.
GTM —	Start with interviews and concierge cohorts, then creator-led proof, then small paid tests around visual week/future-self hooks.
Kill criteria —	Stop or pivot if users cannot explain Canvas causality, D1 is below 20%, paid intent stays below 5%, or video COGS cannot be controlled.
Next step —	Create 3-5 visual examples, clickable prototype, 30-user cohort and one pricing/token experiment.

Development Offer: Phase 1

€5,000

**Phase 1
proof sprint**

**not a full-scale app
build**

Item	Included in €5,000 Phase 1	Not included yet
Prototype	clickable Figma / screen logic / product flow	full native mobile app
Generation pipeline	manual or semi-automated Runway/image workflow for 30-user test	scaled backend with unlimited generation
Content logic	weekly forecast prompts, daily card structure, Life Canvas explanation	large content marketplace
Landing / test	simple landing, price test, lead capture, analytics events	large paid acquisition campaign
Validation pack	30-user cohort plan, metrics, interview script, results template	guaranteed revenue or scale
Alina side	marketing/creator distribution and expert content layer	handled outside development budget

Offer logic: do not sell a huge build yet. Sell a tight proof sprint that verifies product loop, generation cost and paid intent.

AURA

Next step: generate visual examples, assemble clickable prototype, test first 30 users, and verify whether Life Canvas causality is understood.

Prototype → interviews → concierge cohort → paid intent
