

Product / Investor Deck

What AURA Is

- One-line thesis —** AURA is a weekly visual self-guidance app: birth data + personal context → forecast → daily episode → action/reset → Life Canvas change → tomorrow hook.
- User promise —** Not “your zodiac sign says X”. The user should feel: “I understand my week, I did one small action, and I can see how my life picture changed.”
- Core product —** A personal pocket forecastist/assistant with memory, weekly seasons, image-first Life Canvas and rare premium video moments.
- Why now —** Astrology apps monetize personal meaning, mindfulness apps monetize ritual, AI companions monetize memory, video AI creates premium visual moments. AURA joins these behaviors.
- Business rule —** Daily loop must stay cheap. Premium video/avatar must be tokenized, milestone-based or paid, not free daily generation.
- Strategic gate —** If users cannot explain why Life Canvas changed, AURA becomes an AI image toy. If they can, AURA becomes a product.

A

The Product Loop

**The loop is the product: Episode → Action → Reset → Reflection → Life Canvas
→ Tomorrow Hook.**

User Journey: First 30 Days

AURA only works if the user understands the sequence: input → meaning → action → visible change → return tomorrow.

A

Core Screens

These are not final UI designs. They define what the designer must make visible on screen.

A

Life Canvas Must Explain Causality

Before action

After action

Because the user completed the reset and reflection, the Canvas changes from "fog / pressure" to "clear route / grounded self".

If the user says "AI just drew another picture", the product fails. If the user says "the picture changed because I acted", AURA is alive.

A

Premium Video Is a Magic Moment

**WEEK
TRAILER**

Premium video moment

Video should feel like the trailer of your week, not like a free daily content slot.

Veo 8 sec	~\$4 COGS before retries
Runway 8 sec	~\$0.40 COGS proxy
HeyGen 30 sec	~\$1.50-\$2.00 COGS
AURA token	\$2.99-\$9.99 depending quality

The business move: keep subscription image-first, sell rare video as premium forecast / future-self / season trailer.

A

Paywall Architecture

Free \$0 first forecast Day 1 loop one Life Canvas activation	Plus \$9.99-\$14.99/mo daily episodes memory weekly recap limited images retention	Annual \$69-\$89/yr same loop season framing lower churn cashflow	Tokens \$2.99-\$9.99 future-self video Canvas trailer special episode ARPMU uplift
--	--	--	---

Paywall appears after the first completed loop, not before the user understands the product.

Why This Is Not Just Astrology

What existing apps give

- Astrology: meaning, but often generic and passive.
- Mindfulness: ritual, but often not personal enough.
- AI companion: conversation, but not a structured week.
- Avatar tools: visuals, but weak causality.

What AURA combines

- Birth-data context without fatalistic positioning.
- A weekly season that gives structure.
- A daily micro-action that creates agency.
- A Life Canvas that changes for a reason.
- Premium video as rare proof-of-magic, not daily COGS leak.

Market Map

PAM

**consumer
mobile apps**

AI/ML competes for the daily habit of opening an app for meaning, reset and self-direction.

TAM

4 paid behaviors

personal guidance, wellness ritual, AI companion memory, visual identity/avatar progression.

SAM

**apps + web + AI
tools**

existing research covers app stores, web apps, paywalls, adjacent tools and manual competitor walkthroughs.

SOM

100k-300k users

reachable first scale if creator-led GTM, weekly seasons and premium visual moments work.

UP

\$30-80M ARR path

subscription + annual + premium tokens + creator seasons can create venture-relevant upside.

The market is not a single horoscope TAM. It is the overlap of paid personal meaning, daily ritual and AI visual identity.

Competitor Economics: The Read

Co-Star iOS	\$797.5K/mo estimate	2.7M MAU / 64K payers / 2.4% conversion	social astrology can scale with low CAC if language is viral
Nebula iOS	\$718K/mo estimate	2.2M MAU / 52K payers / \$0.33 ARPMAU	paid spiritual guidance works, but aggressive funnels create trust risk
Calm Android	\$2.35M/mo estimate	3.6M MAU / 85K payers / 2.4% conversion	wellness ritual can monetize at scale with annual subscription logic
AstroTime Android	\$440.8K/mo estimate	242K MAU / 11K payers / 4.5% conversion	urgent guidance and human-like help can lift ARPMAU
Replika Android	\$2.36M/mo estimate	99K paying users proxy	memory, avatar, voice and emotional continuity create paid intent

AURA should model base-case like subscription self-discovery, and upside like premium visual/guidance moments.

Astrology Unit Economics

Product	Revenue / scale signal	Visible economics	AURA implication
Co-Star iOS	\$797.5K/mo; 2.7M MAU; 64K payers	ARPM AU ~\$0.30; conversion ~2.4%; \$8.99/mo + IAP	base paid conversion should be 2-3%, not fantasy 8-10%
Nebula iOS	\$718K/mo; 2.2M MAU; 52K payers	ARPM AU ~\$0.33; conversion ~2.4%; \$9.99/mo + weekly IAPs	personal guidance monetizes, but paywall trust is fragile
The Pattern iOS	\$36.1K/mo; 160K MAU; 4K payers	ARPM AU ~\$0.23; conversion ~2.5%	relationship/self-insight works, but depth alone does not guarantee scale
AstroSage Android	\$547.8K/mo; 2.4M MAU; 34K payers	ARPM AU ~\$0.23; conversion ~1.4%	birth-data utility can bring huge reach with lower conversion
AstroTime Android	\$440.8K/mo; 242K MAU; 11K payers	ARPM AU ~\$1.82; conversion ~4.5%	urgent guidance mechanics can lift conversion and ARPM AU
Astrotalk company	Rs 1,214 crore FY25 total revenue reported	consultation marketplace, not pure app subscription	human/expert layer is upside later, not MVP core

Source layer: Rev.now estimates and public company/press reports. Directional benchmarks, not audited internal P&L.

A

Mindfulness Unit Economics

Product	Revenue / scale signal	Visible economics	AURA implication
Calm brand	\$300M/year proxy; 4M+ paying subscribers	\$70/year and \$14.99/mo price anchors	annual wellness subscription can be very large when trust and routine exist
Calm Android	\$2.35M/mo; 3.6M MAU; 85K payers	ARPMU ~\$0.65; conversion ~2.4%	wellness can monetize above astrology ARPMU, but needs retention
Headspace	~\$200M/year brand proxy; app-store proxy	\$12.99/mo price signal	off-store/B2B revenue can understate visible app economics
Waking Up	\$492.7K/mo iOS leaderboard estimate	\$19.99/mo; \$129.99/year	trusted teacher voice can justify premium pricing
Balance Android	\$180K/mo; ~317K MAU; 11K payers	ARPMU ~\$0.57; conversion ~3.5%	personalization can outperform generic meditation libraries
Meditopia iOS	\$118.4K/mo; 629K MAU	ARPMU ~\$0.19	large MAU without strong monetization can still be thin

AURA should borrow daily ritual and annual plan logic, not build a giant meditation library.

A

AI Companion / Avatar Economics

Product	Revenue / scale signal	What people pay for	AURA implication
Character.AI	\$30M-\$32M ARR proxy; c.ai+ \$9.99/mo	priority, memory, engagement, chat volume	AI can monetize engagement, but inference cost and safety dominate
Replika Android	\$2.36M/mo estimate; 99K payers proxy	AI companion, avatar, memory, voice/video features	users pay for emotional continuity, not raw text chat
Finch iOS	\$1.5M-\$2.0M/mo public estimate range	self-care pet, soft progression, daily loop, Plus features	daily companion mechanics can monetize without scary "therapy" positioning
HeyGen / D-ID	API pricing proves avatar video is paid compute	\$0.05-\$0.0667/sec or plan/credit based pricing	talking avatar is a premium event, not free habit content
AURA	\$9.99-\$14.99/mo + tokens target	season, assistant memory, Life Canvas, rare video	must be a cost-controlled AI product under a premium visual wrapper

The avatar is not decoration. It has to show the user why the week changed.

A

What People Actually Pay For

Paid object	Seen in competitors	Why users pay	AURA equivalent
Monthly subscription	Co-Star, Nebula, CHANI, Calm, Balance	regular personal value and lower friction	AURA Plus: weekly season + memory + Life Canvas
Annual subscription	Calm, Headspace, Waking Up, CHANI	commitment and cashflow when trust is formed	\$69-\$89 annual after first completed week
Compatibility / relationship report	Co-Star, The Pattern, Nebula	emotionally high-stakes personal insight	relationship / future-self special episode
Live or urgent guidance	Astrotalk, AstroTime, Astroyogi	anxiety moment: "answer me now"	AI assistant first; human/creator layer later
Special visual asset	soulmate sketch, aura reading, avatar/video tools	ownable image of self/future/period	Life Canvas trailer or future-self video token

Pricing Decision

Plan	Price	Included generation	Target margin logic
Free	\$0	first forecast + Day 1 loop + one medium Life Canvas	COGS target <\$0.20; goal is activation, not generosity
Plus monthly	\$9.99-\$14.99	daily text loop, memory, weekly recap, 2-4 images/mo	net after app fee ~\$8.49-\$12.74; COGS target <\$1.50
Plus annual	\$69-\$89/year	same loop + annual season framing	cashflow and lower churn pressure
Low video token	\$2.99-\$4.99	Runway/Luma-class 5-8 sec visual moment	works if COGS <\$1 and retries are capped
Premium video token	\$6.99-\$9.99	Veo/Replicate/HeyGen high-quality moment	needed when COGS is \$2-\$4+
Creator season	\$14.99-\$29.99	limited guided pack / custom assistant style	monetizes content leverage, not only compute

AURA should not sell unlimited AI. It sells season, memory, causality and rare premium visual events.

Conversion / ARPMAU Assumptions

Metric	Conservative	Base	Strong
Paid conversion	1.5%	2.5-3.0%	4.0-5.0%
Monthly ARPMAU	\$0.20	\$0.35-\$0.50	\$0.80-\$1.50
Monthly price	\$7.99-\$9.99	\$9.99-\$14.99	\$14.99
Token buyer share	3%	8-12%	15-20%
CAC payer	\$300-\$800	\$100-\$250	\$30-\$100
Verdict	content app risk	works if causality is understood	works only with high-intent moments

These assumptions are derived from competitor estimates: Co-Star, Nebula, The Pattern, AstroSage, AstroTime, Calm and Balance.

Generation Cost Benchmarks

Layer	Provider / model	Public price signal	AURA implication
LLM	OpenAI GPT-4.1 mini	\$0.40 / 1M input tokens; \$1.60 / 1M output tokens	daily text loop is cheap if prompts are structured
Image	OpenAI Images	~\$0.01 low / \$0.04 medium / \$0.17 high per square image	Life Canvas can be included if image count is capped
Cinematic video	Google Veo 2 / Vertex AI	~\$0.50 per generated second	8 sec ~= \$4.00; cannot be free daily content
Cinematic video	Runway API	\$0.25 per 5 sec API example	8 sec ~= \$0.40; viable for tests, still needs retry budget
Video model	Replicate Wan 2.1 720p	\$0.24 per output second	8 sec ~= \$1.92; better as paid token / milestone
Talking avatar	HeyGen API Avatar IV/V	\$0.05/sec photo avatar; \$0.0667/sec digital twin	30 sec ~= \$1.50-\$2.00; not a default daily loop
Avatar API	D-ID Build plan	\$14.4/mo annual plan; up to 16 offline video min	~\$0.90/min plan math, but limits/watermark/credits matter

All prices are public API/pricing-page signals as of June 2026; exact billing must be rechecked before procurement.

A

Cost Per User / Month

User type	Usage assumption	Variable AI cost	Business meaning
Free active user	8 text loops + 1 medium image + no video	\$0.10-\$0.20 / MAU	safe if onboarding is capped and no free video exists
Engaged free user	20 text loops + 2 images + no video	\$0.25-\$0.45 / MAU	acceptable only if retention and conversion are visible
Plus subscriber	25 text loops + 4 images + recaps + support	\$0.70-\$1.40 / payer	\$9.99-\$14.99 subscription can hold strong margin
Plus + 1 Veo clip	+ one 8 sec Veo 2 clip	+\$4.00 before retries	margin collapses unless clip is paid separately
Plus + 4 Veo clips	+ weekly 8 sec Veo clip	+\$16.00 before retries	negative economics on consumer subscription
Token video	one paid 8 sec video moment	Runway ~\$0.40 / Replicate ~\$1.92 / Veo ~\$4.00	price token by model quality

COGS = LLM tokens + images + video seconds × provider price + storage + support + failed-generation buffer.

The daily product can be cheap. The wow video must be paid, capped and measurable.

A

Video Cost Stress Test

Scenario	100 users	1,000 users	10,000 users	Conclusion
1 free 8s Veo clip / month	\$400	\$4,000	\$40,000	too expensive before strong paid conversion
4 free 8s Veo clips / month	\$1,600	\$16,000	\$160,000	kills consumer subscription margin
1 paid 8s Runway clip	\$40 COGS	\$400 COGS	\$4,000 COGS	can work as low-price token
1 paid 8s Replicate/Wan clip	\$192 COGS	\$1,920 COGS	\$19,200 COGS	needs \$4.99-\$9.99 token or bundle
1 paid 30s HeyGen avatar	\$150-\$200 COGS	\$1,500-\$2,000	\$15,000-\$20,000	works for premium forecast / assistant moment
Image-first Life Canvas	\$4-\$17 COGS	\$40-\$170	\$400-\$1,700	safe default visual layer

This is the missing math: video is not “a feature”; it is a pricing boundary.

AURA Base Financial Model

Scenario	10k MAU	50k MAU	150k MAU
Paid conversion	1.5%	3.0%	4.5%
Payers	150	1,500	6,750
Gross subscription @ \$11.99	\$1.8K/mo	\$18.0K/mo	\$80.9K/mo
Net after 15% fee	\$1.5K/mo	\$15.3K/mo	\$68.8K/mo
AI/image COGS	\$1.0K-\$2.5K	\$5.0K-\$12.5K	\$15K-\$37.5K
Verdict	thin unless COGS capped	works if no free video	strong if retention + tokens work

Subscription alone is not enough if free COGS is loose. Tokens and annual plans protect margin.

A

Marketing Benchmarks

Competitor / archetype	Public marketing signal	Risk	AURA use
Nebula	\$6.8M/mo YouTube ad spend estimate; 620	paid scale requires high LTV and aggressive funnel	use as paid-test inspiration, not MVP operating model
Nebula prelands	soulmate sketch 10% ad traffic; marriage	curiosity hooks can become scammy	test future-self / visual week / relationship hooks carefully
Co-Star	20M+ downloads with no real marketing spend; 25%	hard to force virality	build shareable identity language and relationship/social hooks
Astrotalk	FY25 total expenses Rs 1,129 crore;	marketplace growth is expensive operationally	do not start with marketplace/expert model
CHANI / Waking Up	trusted founder/teacher voice	requires real authority	use Alina/creator expertise without guru tone

Sources: Web2App World, Axios/TIME, Moneycontrol/ET-style reporting and qualitative product observations.

A

Go-to-Market Strategy

- 1. First 100 are not bought by ads** warm users, interviews, manual weekly forecasts and concierge cohort. Goal: understand the loop, not installs.
- 2. Creator-led proof** micro creators in astrology/self-growth/visual AI pass a 7-day season and show the experience, not a generic ad.
- 3. Short-form hooks** future-self, weekly forecast, avatar transformation, “not horoscope”, before/after Life Canvas and paid-intent CTA.
- 4. Shareable artifacts** Life Canvas card, season recap, future-self poster and trailer week as viral layer after value moment.

A

30-Day Validation Plan

Week 1

20-30 interviews +
manual weekly forecast
concierge

Week 2

10-screen prototype + 2
Life Canvas visual styles

Week 3

landing + price test
\$7.99 / \$9.99 / \$14.99

Week 4

30-50 users through 3-7
days + paid-intent test

Success metrics

>70% understand category / >50% explain Canvas change / D1 >20% / paid intent >5%

Product Scope: MVP vs Later

Layer	MVP	Later	Why
Core loop	Episode → Action → Reset → Reflection → Life Canvas	season branching and deeper memory	must prove causality first
Assistant	chosen tone + weekly context + memory summary	voice/video assistant, creator voices	text memory is cheaper and faster to validate
Visual layer	image-first Life Canvas + avatar style	cinematic video, talking avatar	video is premium COGS
Monetization	Plus + annual + one token test	creator seasons, expert layer, marketplace	avoid operational complexity before retention
Community	none in MVP	sharing, social, cohorts	do not build social network before core value is proven

A

Risks

Risk	How it breaks	Mitigation
Looks like horoscope	user thinks it is generic astrology	position as weekly life-series and action, not fate
Avatar feels random	user cannot explain visual change	show cause next to Canvas and tie it to action/reflection
Video cost kills margin	free users generate expensive clips	premium/token video only; log COGS per asset
AI sounds generic	low trust and no return	prompt QA, user feedback and memory guardrails
No paid intent	users like it but do not pay	paywall after first completed loop and price tests by cohort

Growth Roadmap

The roadmap stays narrow until the loop is proven: first causality, then retention, then paid scale.

What We Should Build

Product —	A weekly visual self-guidance app where the user enters birth data/context, receives a forecast, completes daily micro-actions, and sees Life Canvas evolve.
MVP —	Text-first assistant, weekly season, daily episode, action/reset/reflection, image-first Life Canvas, Plus paywall, one premium video token test.
Pricing —	\$9.99-\$14.99 monthly, \$69-\$89 annual, \$2.99-\$9.99 visual/video tokens, no unlimited generation.
GTM —	Start with interviews and concierge cohorts, then creator-led proof, then small paid tests around visual week/future-self hooks.
Kill criteria —	Stop or pivot if users cannot explain Canvas causality, D1 is below 20%, paid intent stays below 5%, or video COGS cannot be controlled.
Next step —	Create 3-5 visual examples, clickable prototype, 30-user cohort and one pricing/token experiment.

AURA

Next step: generate visual examples, assemble clickable prototype, test first 30 users, and verify whether Life Canvas causality is understood.

Prototype → interviews → concierge cohort → paid intent
