P0 app inspections

This pack is the designed reading layer on top of the evidence-first research OS. It summarizes what is currently supported, what is merely directional, and what still needs validation before any final market or product claim.

**Publication-ready evidence draft. It is not final validated investor proof: manual competitor inspection, in-app paywall validation, ICP interviews, and prototype/user sessions remain open gates.**

## Executive Read

| Area          | Current read                                                                                     | Proof level                          |
|---------------|--------------------------------------------------------------------------------------------------|--------------------------------------|
| Product shape | Adjacent primitives exist; strict action-to-avatar causality is queued for manual inspection.    | Medium, inspection-ready             |
| Market money  | Paid behavior is visible through IAP, Google Play, web/paywall, and competitor revenue proxies.  | Medium-high proxy, not revenue proof |
| Whitespace    | Narrow opening remains behavior-tied identity/avatar progression after a completed daily action. | Medium, hidden clone risk open       |
| Audience      | ICP hypotheses point to ritual/self-improvement/spirituality/calm/cozy-progress users.           | Directional, validation-ready        |
| Product core  | Prototype stimulus translates the thesis into an 8-screen two-minute validation loop.            | Ready, unvalidated                   |

# Evidence Dashboard

| Evidence layer                    | Count | Interpretation                                                               |
|-----------------------------------|-------|------------------------------------------------------------------------------|
| Five-market coverage              | 5     | Core markets represented in the normalized universe.                         |
| Known raw universe                | 30795 | Core + itch.io + Steam tag rows exceed the 30k lower-bound target.           |
| Deduped source universe           | 12552 | Normalized rows for matrices and scoring.                                    |
| Manifest source-like refs         | 93167 | Rows with URLs, package IDs, domains, source IDs, or comparable identifiers. |
| Top-100 primary apps              | 90    | Human-facing competitor review layer.                                        |
| Behavior-tied progression signals | 1     | Strict signal is rare in metadata, hence manual inspection is critical.      |
| P0 public listings inspected      | 12    | No-broad-search inspection of existing App Store listing excerpts.           |
| Visible public causality cases    | 1     | Highest-priority walkthrough target; not final clone proof.                  |
| Manual rubric dimensions          | 6     | Dimensions for causality, hidden clone risk, paywall, and final verdict.     |
| ICP segments                      | 6     | Segment hypotheses to test before product commitment.                        |
| Prototype scorecard metrics       | 6     | Success/kill metrics for the two-minute loop.                                |

## Evidence status mix

# Requirement Status Matrix

The completion audit keeps the project honest: the evidence package is substantial, but several requirements remain draft, directional, or validation-ready instead of final.

| Requirement                  | Status                                                     | Strength    | Remaining gap                                                                                                                                            |
|------------------------------|------------------------------------------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| REQ_01_MASTER_PLAN           | proved_v1                                                  | strong      | Keep refreshing as validation results change.                                                                                                            |
| REQ_02_COMPETITOR_UNIVERSE   | proved_scale_target                                        | medium_high | Below aspirational 30k-50k raw source/app target; desktop stores, Product Hunt/AlternativeTo, B2B directories, forums, and curated lists remain backl... |
| REQ_03_FIVE_MARKET_COVERAGE  | proved_v1                                                  | strong      | Gaming should remain benchmark-only unless direct consumer overlap is validated.                                                                         |
| REQ_04_MARKET_MONEY          | supported_with_bottom_up_proxy_not_final                   | medium_high | Market sizing remains range-based; actual revenue estimates and manual in-app payroll validation are needed for final investor-grade claims.             |
| REQ_05_WHITESPACE            | narrow_supported_public_listing_inspected_walkthrough_open | medium      | Public listings for the P0 wave are inspected, but metadata/public copy can miss hidden in-app mechanics; app/onboarding walkthrough screenshots are...  |
| REQ_06_AUDIENCE_ICP          | directionally_supported_validation_ready                   | medium      | Segments are directional and need interviews/prototype/WTP validation.                                                                                   |
| REQ_07_COMPETITIVE_ADVANTAGE | prototype_stimulus_ready_not_validated                     | medium      | No completed user/prototype sessions prove the loop is understood/preferred.                                                                             |
| REQ_08_REPORT_PDF            | polished_evidence_draft_done_not_validated_final           | medium_high | Polished evidence PDF exists as a publication-ready draft, but it is not final validated investor/user-facing proof because manual competitor inspect... |

| REQ_10_VALIDATION_GATES      | proved_v1_open_gates                                       | strong      | Open P0 gates remain: app/onboarding walkthrough screenshots, payroll human sign-off, whitespace validation, competitive advantage prototype sessions... |

## Completion audit status mix

## Market-Money Proxy Read

The strongest current claim is not exact revenue. It is that adjacent markets contain visible paid behavior and credible monetization surfaces worth validating more deeply.

| Market                    | Reviewed | Strong | Medium+ | Observed IAP | Market money read                   |
|---------------------------|----------|--------|---------|--------------|-------------------------------------|
| astrology_esoterics       | 44       | 8      | 35      | 39           | bottom_up_paid_behavior_visible     |
| avatar_identity           | 22       | 7      | 16      | 18           | bottom_up_paid_behavior_visible     |
| coaching_self_improvement | 14       | 5      | 11      | 13           | bottom_up_paid_behavior_visible     |
| mindfulness               | 5        | 2      | 4       | 5            | bottom_up_paid_behavior_directional |
| gaming_progression        | 5        | 0      | 4       | 5            | bottom_up_paid_behavior_directional |

| Paywall visual layer             | Count | Read                                               |
|----------------------------------|-------|----------------------------------------------------|
| Confirmed visible public pricing | 2     | Narrow, concrete public price evidence.            |
| Partial paid-surface examples    | 8     | Useful signal, needs human or in-app sign-off.     |
| Total adjudicated screenshots    | 29    | Evidence quality layer over raw web pages and OCR. |

# Whitespace And Competitor Inspection

The current whitespace thesis is intentionally narrow: not 'no competitors', but 'few visible solutions make identity/avatar progression causally respond to a completed daily action across meaning, action, reset, and progress'.

| Rank | App                            | Prefill verdict                | Money proxy                  | Why inspect                                                                                                                |

| 12   | Habit Tracker                  | high_priority_close_substitute | strong_bottom_up_money_proxy | strong_money_proxy deep_review_language                                                                                    |

| Public listing execution           | Count | Read                                                                                 |
|------------------------------------|-------|--------------------------------------------------------------------------------------|
| P0 public listings inspected       | 12    | Public App Store copy/excerpts reviewed without broad search.                        |
| Visible action-to-avatar causality | 1     | High-risk case for immediate walkthrough.                                            |
| High public hidden-clone risk      | 1     | Requires onboarding/action/progress screenshots before H3 is upgraded or downgraded. |

| Inspection gate                     | Pass condition                                                | Fail condition                                                        |
|-------------------------------------|---------------------------------------------------------------|-----------------------------------------------------------------------|
| Action -> identity/avatar causality | Completion visibly changes progress/avatar/identity feedback. | Metadata claim is decorative, generic, or blocked before first value. |
| Hidden direct clone risk            | Flow confirms a close substitute and updates whitespace risk. | Flow is unrelated or lacks coherent daily transformation loop.        |
| Paywall boundary                    | First meaningful value and paywall timing are captured.       | Paid surface remains unknown or login/app-store-only.                 |

# Audience And Prototype Validation

The pack now has enough structure to run user validation without improvising the product story: two ICP segments, an 8-screen stimulus, and six success/kill metrics.

| Segment                                            | Evidence band          | Primary job                                                               | Risk to validate                                                                                            |
|----------------------------------------------------|------------------------|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|

| P1 validation roadmap rows     | 9     |

## Open Gates Before Final Claim

The next work should close validation gates rather than inflate claims. These gates decide whether the report graduates from polished evidence draft to final validated strategy.

| Gate                         | Why it matters                                                                                                                                                | Next action                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| REQ_04_MARKET_MONEY          | Market sizing remains range-based; actual revenue estimates and manual in-app paywall validation are needed for final investor-grade claims.                  | Manually validate the highest competitor money proxies and add paid/credible revenue intelligence where available.                        |
| REQ_05_WHITESPACE            | Public listings for the P0 wave are inspected, but metadata/public copy can miss hidden in-app mechanics; app/onboarding walkthrough screenshots are still... | Use the public-listing risk reads to prioritize walkthrough screenshots for onboarding, first action, progress/avatar feedback, and pa... |
| REQ_06_AUDIENCE_ICP          | Segments are directional and need interviews/prototype/WTP validation.                                                                                        | Run ICP validation packet for top two segments.                                                                                           |
| REQ_07_COMPETITIVE_ADVANTAGE | No completed user/prototype sessions prove the loop is understood/preferred.                                                                                  | Run prototype sessions with the top two ICP segments and record comprehension, meaning lift, differentiation, return intent, and paid-... |
| REQ_08_REPORT_PDF            | Polished evidence PDF exists as a publication-ready draft, but it is not final validated investor/user-facing proof because manual competitor inspection a... | After manual inspection and prototype sessions, update the pack with validated screenshots, scorecards, and final claim statuses.         |

## Evidence File Map

| Evidence group   | Primary files                                                                                                                           |
